EUROGEO WORKSHOP 2023

The FloWS -SOL performance (2019-2022) for events exceeding yellow discharge threshold

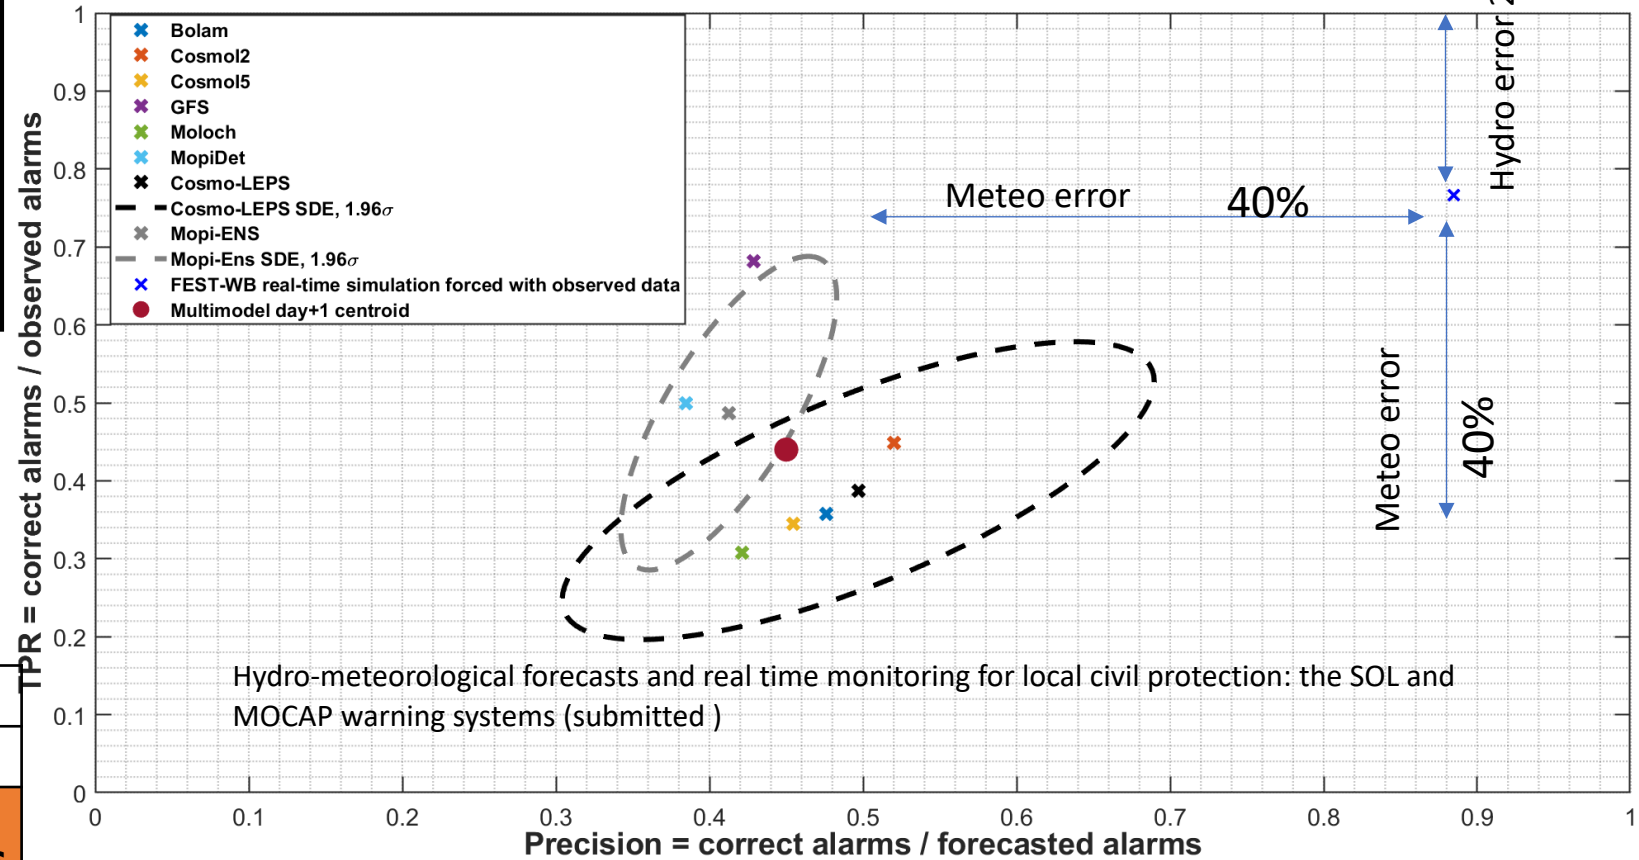

% Forecast correct alarm / observed alarm (True Positive Ratio)

$$TPR = \frac{Hits}{Hits + False\ Negatives}$$

$$Precision = \frac{Hits}{Hits + False\ Positives}$$

Exceeding of discharge treshold		Observed alarm	
		Yes	No
Predicted alarm	Yes	Hits	False Positives
	No	False Negatives	True Negatives

Multi-model scores for the day+1 forecast (Precision-Recall plot or "performance plot")

Hydro-meteorological forecasts and real time monitoring for local civil protection: the SOL and MOCAP warning systems (submitted)

Do we prefer systems that minimize false (precision) or missed alarms (TPR) ?

EUROGEO WORKSHOP 2023

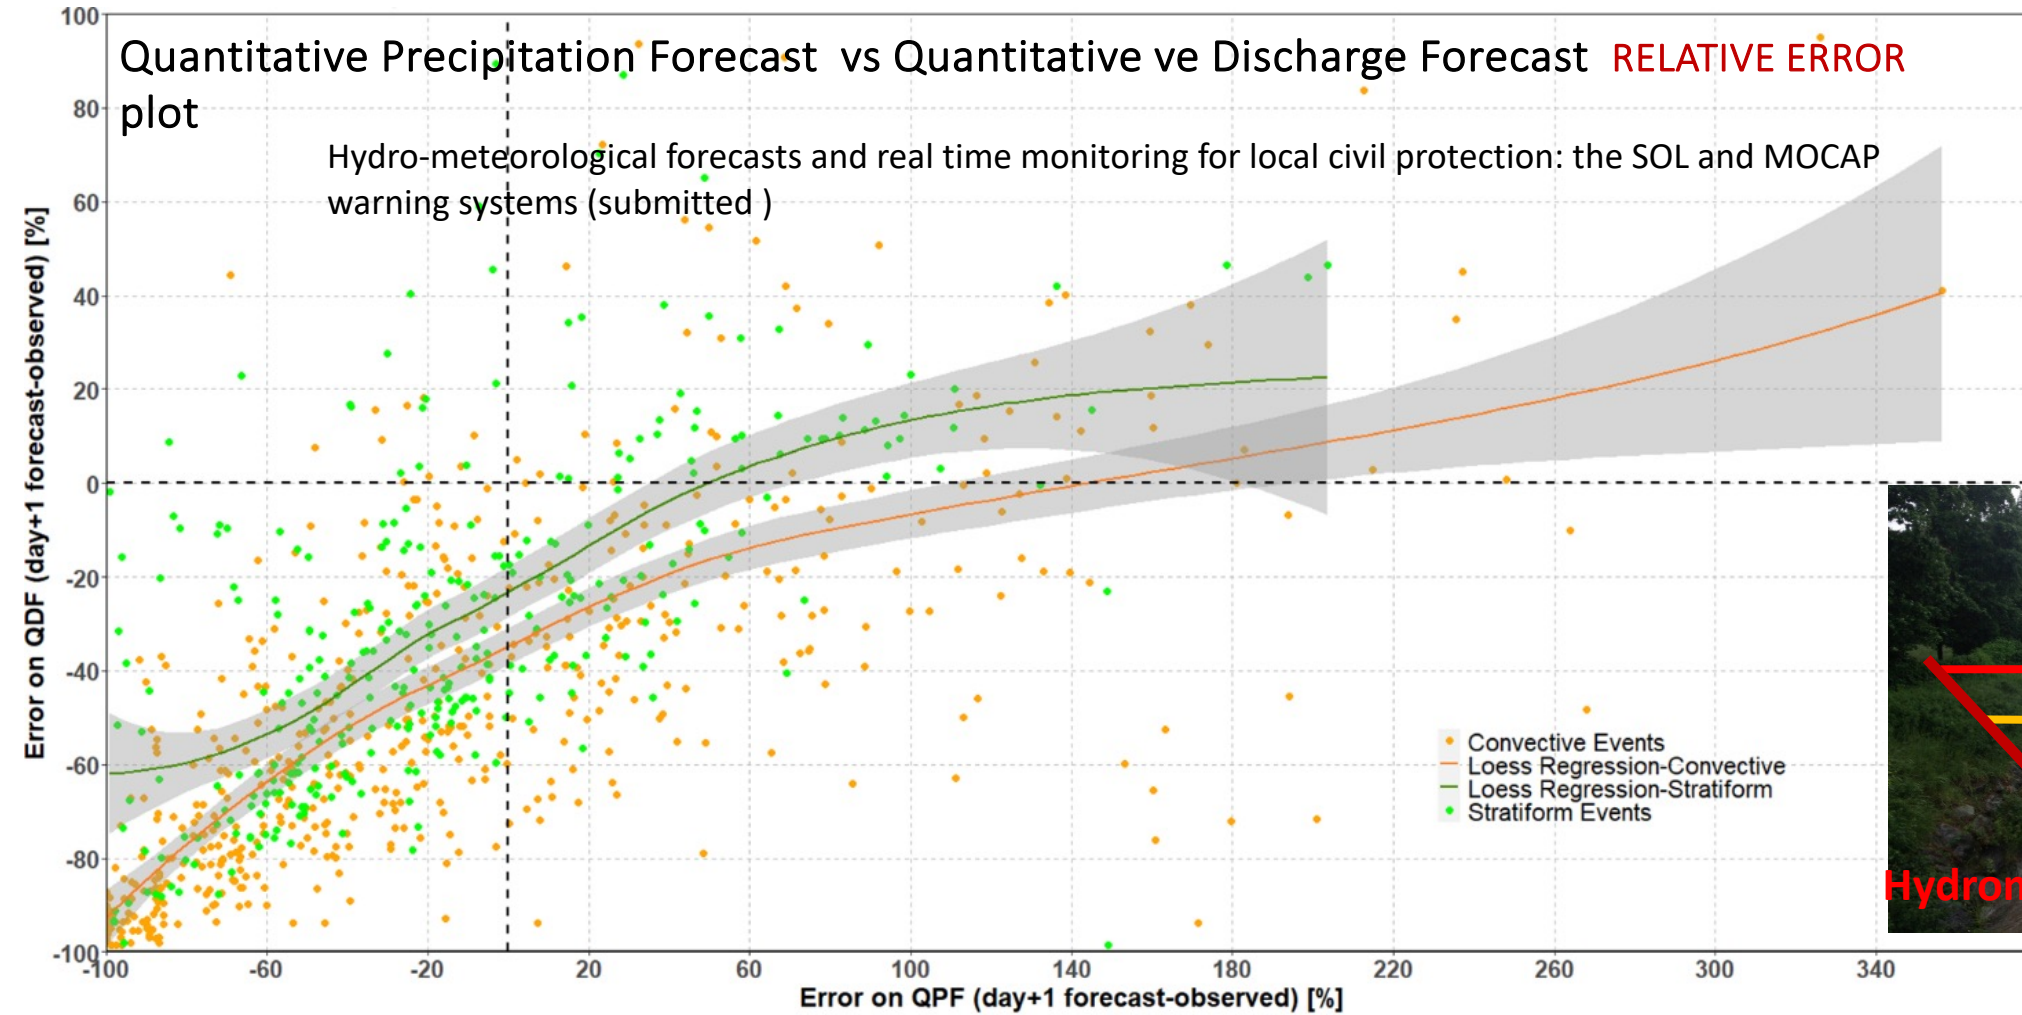

The FloWS -SOL performance (2019-2022) for events exceeding yellow discharge threshold in one cross section (Seveso @ Bovisio Masciago)

Observed rainfall &FEST-WB (2019-2022)

	FEST-WB
Hits	23
False alarms	3
Missed alarms	7
TPR	0.77
PPV	0.88

Hydrometric Warning thresholds

QPF (Quantitative Precipitation Forecast) vs **QDF** (Quantitative discharge forecast) relative error evaluation for all the observed events exceeding the first warning threshold at the **day+1**, separating between **stratiform** and **convective** events.

Conclusion

Flood warning systems using Multi Model Meteo Forecast may be realized as non structural measure for flood damage reduction .

Meteo Model configurations that maximize the % of correct forecasted alarms respect to all observed allarm (TPR) have to be preferred

Structural hydraulic work design discharge may be reduced considering the cost benefit analysis supported also by early warning systems for residual risk management.

Smaller design discharge implies smaller structural works with higher social acceptance and smaller maintenance costs.

Came safely to Milan!

Thank you for your attention
