

E4WARNING

Eco-Epidemiological Intelligence for early Warning and response to mosquito-borne disease risk in Endemic and Emergence settings – **EO in Action**

William Wint for Frederic Bartumeus

Context - ONE HEALTH approach **with EO help**

INTERDISCIPLINARY
INNOVATIVE | OPEN SCIENCE

- Spatial statistical modelling

Better disease intelligence capable of anticipating and identifying MBDs epidemic risk and outbreaks.

Basic logic

Dengue looks likely to establish and spread in Europe. As it is not yet widely established here, so we have to use what we know about the disease in endemic areas to forecast what will happen in Europe

We are refining dynamic disease models and forecasting tools for a number of endemic areas, and extending these to several identified hotspots from which it is being imported to Europe. **Climate by EO**

We are using **EO data** and novel vector sampling methods like automated traps and citizen science monitoring to develop vector and host distribution spatial models at different scales (urban, regional, continental) and to allow environmentally driven disease risk forecasting.

We also need to know how it might spread once it arrives, by looking at 1) spillover from natural areas like wetlands to peri urban and urban areas where the vectors are most widespread; and 2) spread in and between urban areas through for example human movement. **EO needed for climate and geography**

We are quantifying how it is being imported from endemic areas into Europe, and using our results for spread forecasting to project how it might spread once it arrives. **Some spread drivers from EO**

Project structure

Citizen science

IoT Smart traps

High quality real-time **information on vectors** for a scalable and flexible “epidemic intelligence”

WP2, WP3

EO climate
Covariate data suite

Water availability models

Estimate and anticipate **mosquito prevalence and disease risk**

WP4

Ecosystem barriers to disease spread

Human mobility

Host and vector **dispersal capacities**
Human **activity** and differential disease **exposure** affecting spread

WP5

Endemic Disease models

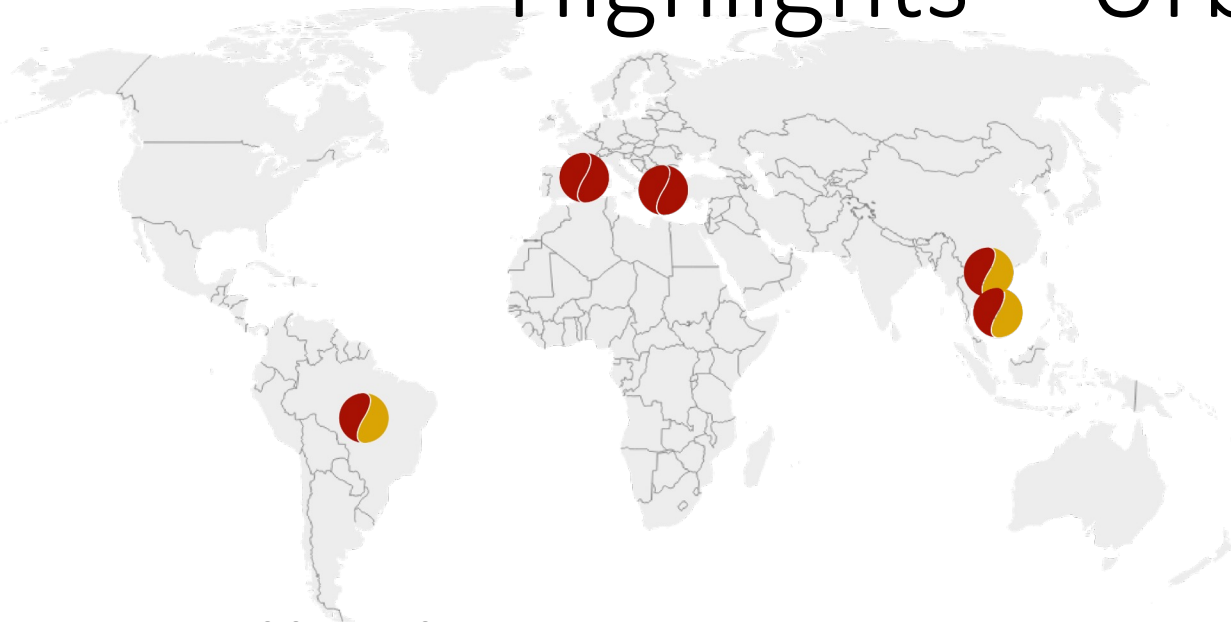

Dengue import

Dengue forecasting endemic hotspots used together with global traffic patterns to anticipate connectivity and **import risk** to Europe

WP6, WP7

Highlights - Urban environments

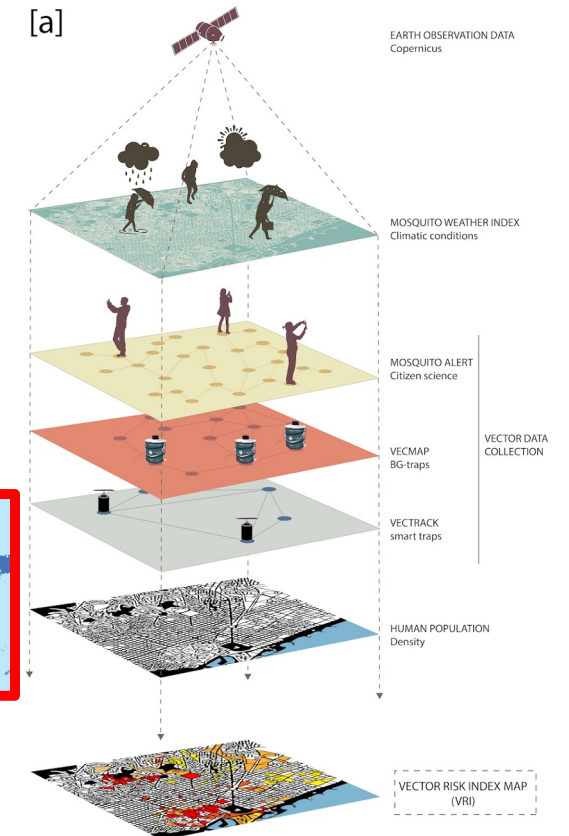

- Athens
- Barcelona
- Brasilia
- Hanoi / Ho Chi Minh City

- *Aedes albopictus*
- *Aedes aegypti*

- Citizen science
- Traditional surveillance
- IoT Smart traps
- **Earth Observation data**
- **Climatological data**
- Human activity-spaces
- Human mobility

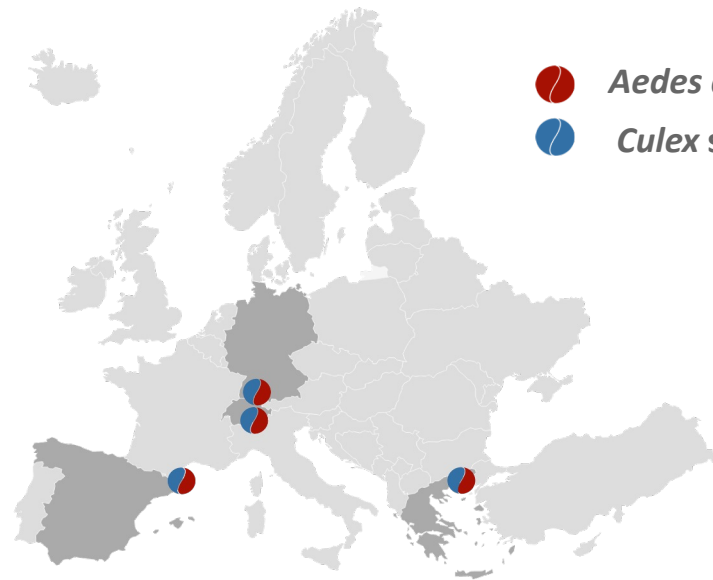

- ❖ **Vector presence**
- ❖ Vector phenology
- ❖ Vector abundance
- ❖ Vector activity
- ❖ Human-vector interaction
- ❖ Vector passive dispersal

Highlights – spillover from wetlands to peri urban

- *Aedes albopictus* introduced + DENV imported
- *Culex* sp. WNV suspected

MARK-RELEASE-RECAPTURE (MRR) &

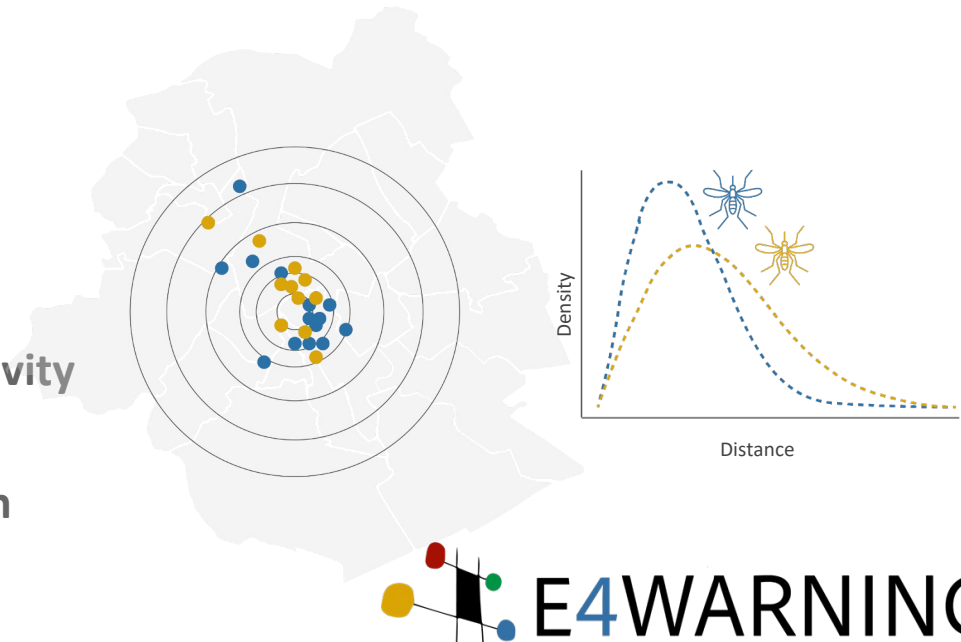

self-MARK AND CAPTURE (sMC):

To estimate dispersal capacity and dispersal-mediated connectivity between wetlands, peri-urban and urban areas of *Aedes albopictus* & *Culex pipiens*

- self-Mark and Capture (*Culex*)
- Mark-Release-Recapture (*Aedes*)
- Biologging of birds in field
- Human-vector interaction
- **Habitat identification**
- Human mobility

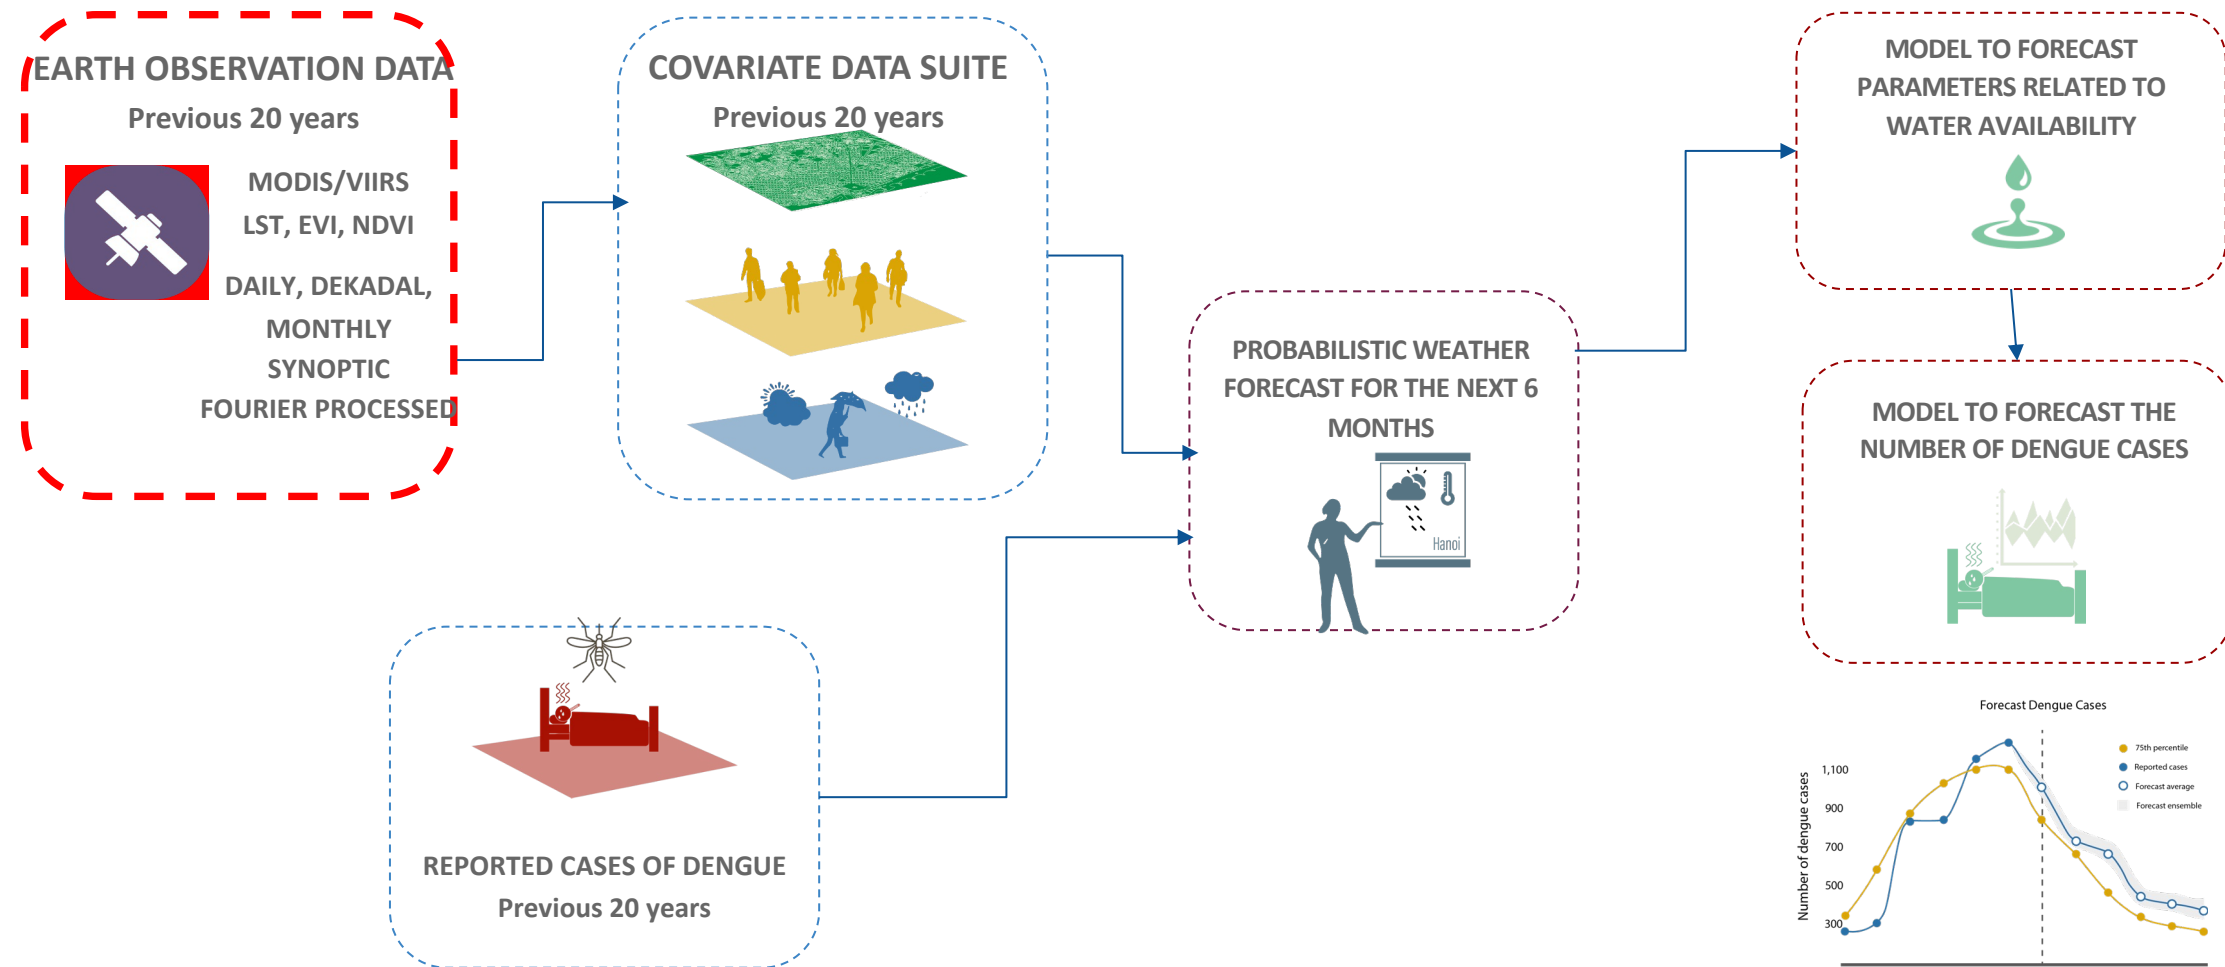

- ❖ Vector dispersal capacity
- ❖ Reservoirs home ranges
- ❖ Reservoirs behaviour activity
- ❖ Vector activity
- ❖ Human-vector interaction
- ❖ Vector passive dispersal

Endemic Disease to inform EU models

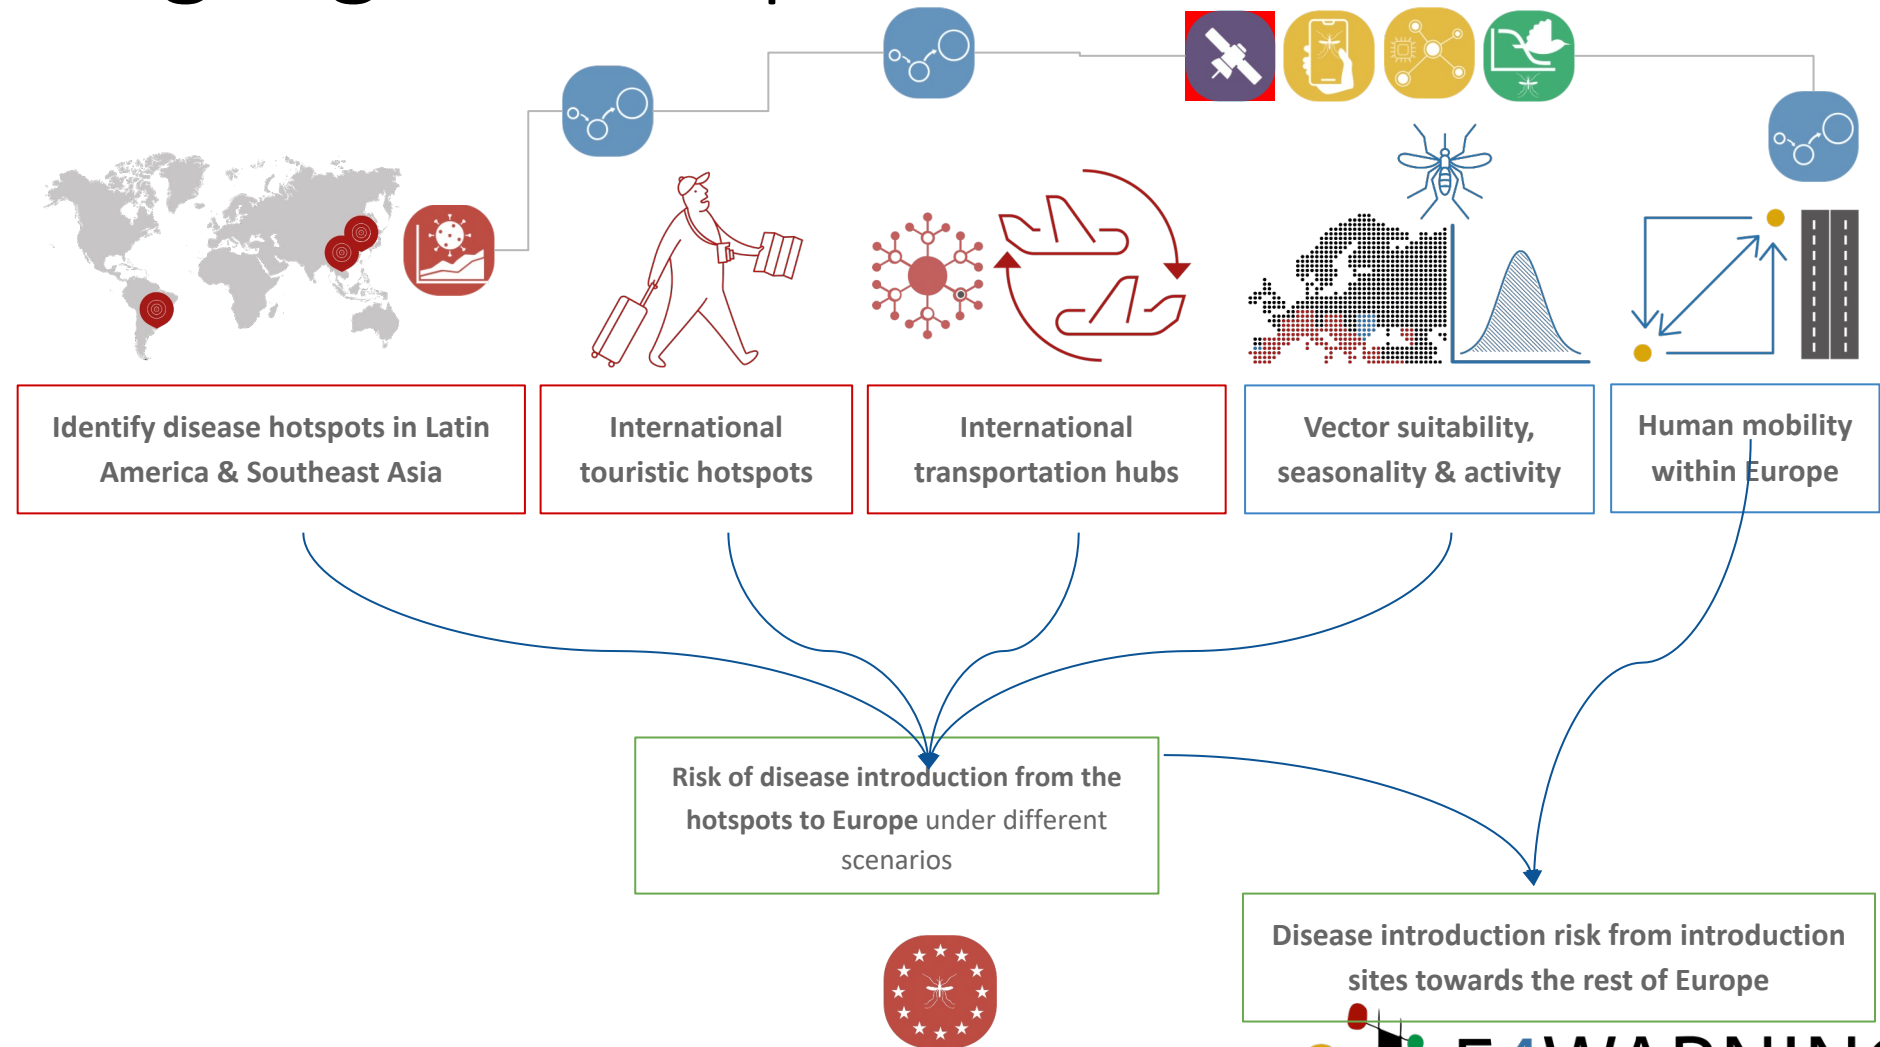

Highlights – Import to EU

MOSQUITO ALERT
